```
The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense concluded acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway confideration, (7) identifying a compound that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profilling a compound's activity; (11) a culture comprising strains in which the gene compound activity; (11) a culture comprising strains in which the gene compound the activity (12) determining the extent
                                                                                                                                        .;

to which each of the strains is present in a culture or collection of strains, or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to the isolation of the Streptomyces atroolivaceus leinamycin (Lnm) biosynthesis gene cluster containing 71 open reading frames (ORFs -35 through -1, ORFs lnm through lnm2, and ORFs +1 through +9). Leinamycin is a novel anti-tumour antibiotic produced by several Streptomyces species. It exhibits broad spectrum antimicrobial activity against Gram-positive and Gram-negative bacteria, but not against fungi. The polypeptides encoded by the Lnm biosynthesis gene cluster ORFs are useful for chemically modifying a molecule in a host cell. The host cell is a bacterium or eukaryotic cell, including a
                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Protein encoded by S. atroolivaceus leinamycin gene cluster ORF lnmV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel gene cluster responsible for synthesis of leinamycin in Streptomyces atroclivaceus useful for making various peptide and/or polyketide, and/or hybrid polypeptide/polyketide metabolites.

                                                                                                                                                                                                                                                                                                                                                                                                                  23 - JUN-
                                                                                                                                                                        07-JUN
       cc mammalian, yeast, plant, fungal, or insect cell. The molecule is an endogenous metabolite produced by the host cell or exogenously supplied congenous metabolite, or an amino acid, and the polypeptide is a peptide synthetase or amino transferase. The polypeptides encoded by the Lmn gene cluster converting an apo-carrier protein to a holo-carrier protein. Inm shows potent antitumour activity in tumour models in vivo. The Inm gene cluster modules and/or catalytic domains are useful for making various peptide and/or polyketide, and/or hybrid polypeptide/polyketide metabolites. The proteins encoded by the ORFs are useful alone, or in combination with other active domains to modify various target substrates. The Lmn gene cluster is useful to upregulate endogenous Lnm production to permit Lnm production in cells and/or to make various modified Lnm. Lnm, its analoque, or other polyketide, completed or hybrid polyketide/peptide metabolites are useful as the peptide or hybrid polyketide/peptide metabolites are useful as the completer completer and number of disorders, depending upon the type of metabolites. ABUI1311-ABUI1411 represent the proteins encoded by ONFS of the S. atroolivaceus leinamycin blosynthesis gene cluster
                                                                                                                                                                                                                                     o;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to isolated canine low affinity immunoglobulin E (IgB) receptor (CD23) polypetides and encoding nucleic acid molecules. The CD23 polypeptides can be expressed by standard recombinant methodology. The CD23 polymucleotides are useful for protecting canids from diseases mediated by CD23, for developing compounds that regulate IgB and/or CD23 lavels in a canid for treating allergy related diseases such as aropic dermatitis, asthma, hay fever and food sensitivities. The present sequence represents a CD23 receptor PsCaCD23_123
                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated canine low affinity immunoglobulin B receptor nucleic ar molecule, useful for protecting canids from diseases mediated by the receptor, such as allergy, atopic dermatitis, asthma, and hay fever.
                                                                                                                                                                                                                                                                                                                                                                                                                                      Canine; immunoglobulin E; IgE; CD23; antiallergic; antiasthmatic; antiinflammatory; dermatological; gene therapy; vaccine; receptor.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is a polypeptide encoded by one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. The 5' ESTs were brepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors
                                                                                                                                                                                                          Human; 5' EST; expressed sequence tag; secreted protein; cDNA isolation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to isolated nucleic acid molecules and their can concoded secreted proteins. The nucleic acids and proteins are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a also used in diagnosing a pathological condition. Antibodies to the proteins can also be used in alleviating symptoms associated with the disorders and in diagnostic immunossays e.g. radioimmunossays or enzyme linked immunosorbant assays (BLISA). Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. carbovascular disorders e.g. crachism and coular disorders e.g. corneal infections and many other disorders listed in the specification. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemetaxis. The polypeptides can also be used as a food additive or preservative to increase or derage or derage can also be used as a food additive or preservative to increase or derage and another distance or derage or derage or derage or derage or derage and increase or derage or derage and increase or derage and another distance or derage or derage or derage and another distance or derage or derage and another distance or derage or derage or derage and another distance or derage or derage and another distance or derage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           .;

        polynucleotides. The polypeptides and polynucleotides are useful in gene therapy for treating, inhibiting or preventing neural disorders, immune system disorders (e.g. system) clubus erythematosus, rheumatoid arthritis and multiple sclerosis), muscular disorders, respiratory diseases (e.g. and multiple sclerosis), muscular disorders, gastrointestinal disorders, pulmonary disorders, cardiovascular disorders (e.g. congenital heart defects, Ebstein's anomaly and hypoplastic left heart syndrome), renal disorders (e.g. acute kidney failure and end-stage renal disease), hyperproliferative disorders (e.g. Hodgkin's disease and appendicitis), allergic reactions and conditions (e.g. asthma), blood appendicitis), allergic reactions and conditions (e.g. asthma) blood infarction) and cancerous diseases. Sequences ABUS4914-ABUS5699 and ABUS5748 represent human novel polypeptides of the invention
                                                                                                                                                                                                                                                                                                                                                   Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter;

The invention relates to isolated polymuclectide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymuclectides are also used in diagnostics as expressed sequence tags for identifying expressed considerably leading to the constant of sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders consupplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders consupplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders consupplements to polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations of and to produce other types of data and products dependent on DNA and amino acid sequences. Abgonolo-Abganous consumption of the sequence data for this patent did not appear in the printed specification, but was obtained in celectronic format directly from WIDO at consumption of the consument of New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity. Human, chromosome mapping, gene mapping, gene therapy, forensic, food supplement, medical imaging, diagnostic, genetic disorder. 100.0%; Score 25; DB 3; Length 126; 50.0%; Pred. No. 2e+03; Pred. Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

hypothetical 14.7K protein - African swine fever virus
NiAlternate names: open reading frame D129L
Cippedies: African swine fever virus, ASFV
Cipate: 30-Sep-1993 #sequence_revision 20-Aug-1994 #text_change 21-Jul-2000

Richater, R. J.; Rodriguez, J.M.; Boursnell, M.; Rodriguez, J.F.; Vinuela, E.
Gene 134, 161-174, 1993
Afritle: Two putative African swine fever virus helicases similar to yeast 'DEAH' pre-mh
A;Reference number: JT0665; MUID:94085774; PMID:8262374
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Pypothetical protein Imool51 [imported] - Listeria monocytogenes (strain EGD-e)
C;Species: Listeria monocytogenes
C;Species: Listeria H1093

Divisory photosystem I chain III - Odontella sinensis chloroplast
NiAlternate names: photosystem I plastocyanin-binding chain
CiSpecies: chloroplast Odontella sinensis
CiDate: 17-Feb-1998 #sequence_revision 26-Feb-1998 #text_change 20-Jun-2000
CiAccession: 578329
R;Kowallik, K.V.; Stoebe, B.; Schaffran, I.; Kroth-Pancic, P.; Freier, U.
Plant Mol. Biol. Rep. 13, 336-342, 1995
A;Title: The Chloroplast Genome of a chlorophyll a+c- containing Alga, Odontella sinens
A;Reference number: 57823
A;Accession: 57832
A;Accession: S7832
A;Accession: preliminary; nucleic acid sequence not shown; translation not shown
A;Molecule type: DN
A;Residues: 1-185 <KCW>
A;Residues: 1-185 <KCW>

Hypothetical protein MTH578 - Methanobacterium thermoautotrophicum (strain Delta H)

Gispecies: Methanobacterium thermoautotrophicum (strain Methanobacterium thermoautotrophicum Delta H: func Michaeler (strain 179, 7135-7155, 1997

A) Title: Complete genome sequence of Methanobacterium thermoautotrophicum Delta H: func A; Reference number: A69000; MUID:98037514; PMID:9371463

A) Accession: E69176

A) Astatus: preliminary; nucleic acid sequence not shown; translation not shown

A; Residues: 1-186 < MTH>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               A;Cross-references: GB:AE000840; GB:AE000666; NID:g2621653; PIDN:AABB5084.1; PID:g26216

Franslation initiation factor IF-3 - Mycoplasma pneumoniae (strain ATCC 29342)

NyAlternate names: hypothetical protein C09_orf201

C;Species: Mycoplasma pneumoniae

A;Variety: ATCC 29342

A;Variety: ATCC 29342

C;Date: 25-Feb-1997

R;Hibert, H.; Plagens, H.; Pirkl, E.; Li, B.C.; Herrmann, R.

Nucleic Acids Ree. 24, 4420-4449, 1996

A;Ritle: Complete sequence analysis of the genome of the bacterium Mycoplasma pneumoniae

A;Reference number: S73327; MUID:97105885; PMID:8948633
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          NID:g1673684; PIDN:AAB95687.1; PID:g167368 to the EMBL Data Library, November 1996
